

Incident Planning and Execution Module

- Graphical decision trees
- "If this, then this" logic
- Auto-communications dispatch
- Automated electronic mutual aid
- Secure multi-agency alerting, collaboration and two way communication (radio, voice, data, video)
- Automated status reporting
- Post-event auditing

Designed to leverage the advantages of SmartMsg, the ScenarioMgr integrated incident planning and execution tool automates emergency event response, workflow execution and exercise planning. ScenarioMgr integrates first-responder and citizen alerting functions, communications interoperability and multi-agency collaboration to provide a secure, reliable and flexible means to automatically initiate and manage multiple streams of communication.

ScenarioMgr employs tiered response plans to automate everything from the most basic communication requirements to comprehensive management of rapidly developing crisis scenarios. Scenarios may consist of any series of actions, including broadcasting alerts; evaluating alert responses; sourcing data from external systems; creating talk groups; activating standby channels; and much more.

Sequences of events are chained together to trigger pre-defined tasks and procedures in a step-by-step, graphical decision-tree format. "If this, then this" logic enables the system to adapt the process and sequence execution for faster, more effective response to rapidly unfolding events.

ScenarioMgr can be launched from anywhere, at anytime, from any device capable of accessing SmartMsg. This highly flexible automation tool can be tailored to communicate with external systems using XML, SQL and VoIP to either poll external systems or permit external events to initiate incident scenarios.

Specifically developed for network operation centers, Emergency Operation Centers, and IT help desks for both commercial or government enterprises, ScenarioMgr complies with NIMS/UICS standards supporting electronic execution of response plans and mutual-aid requests.
